

How to start a New Project Eclipse

1. Create a new project

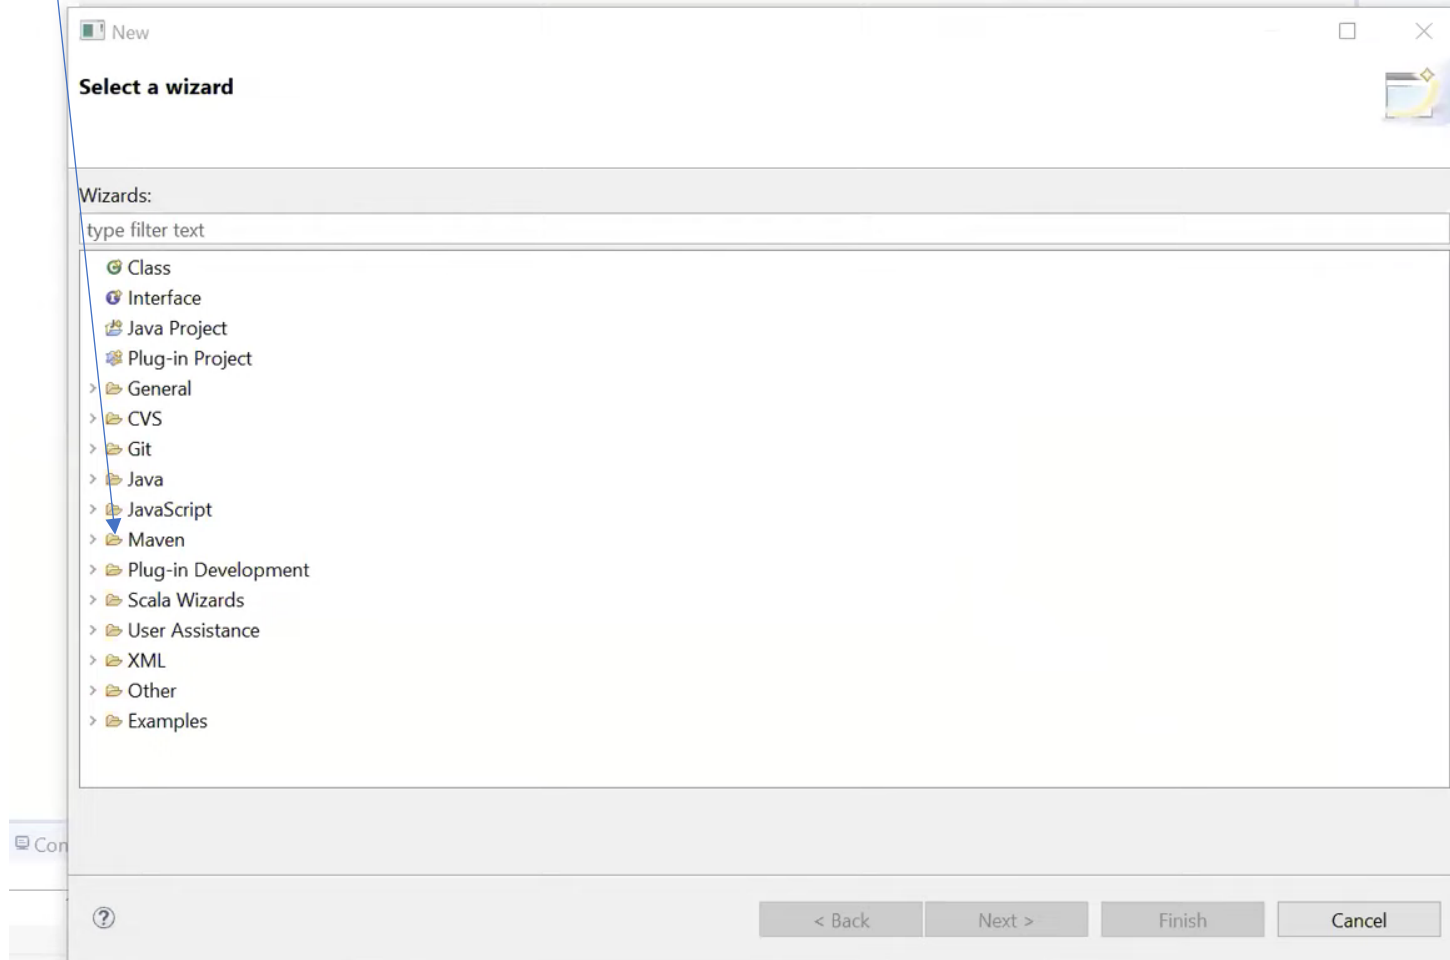

1. Download Eclipse from <http://scala-ide.org/download/sdk.html>

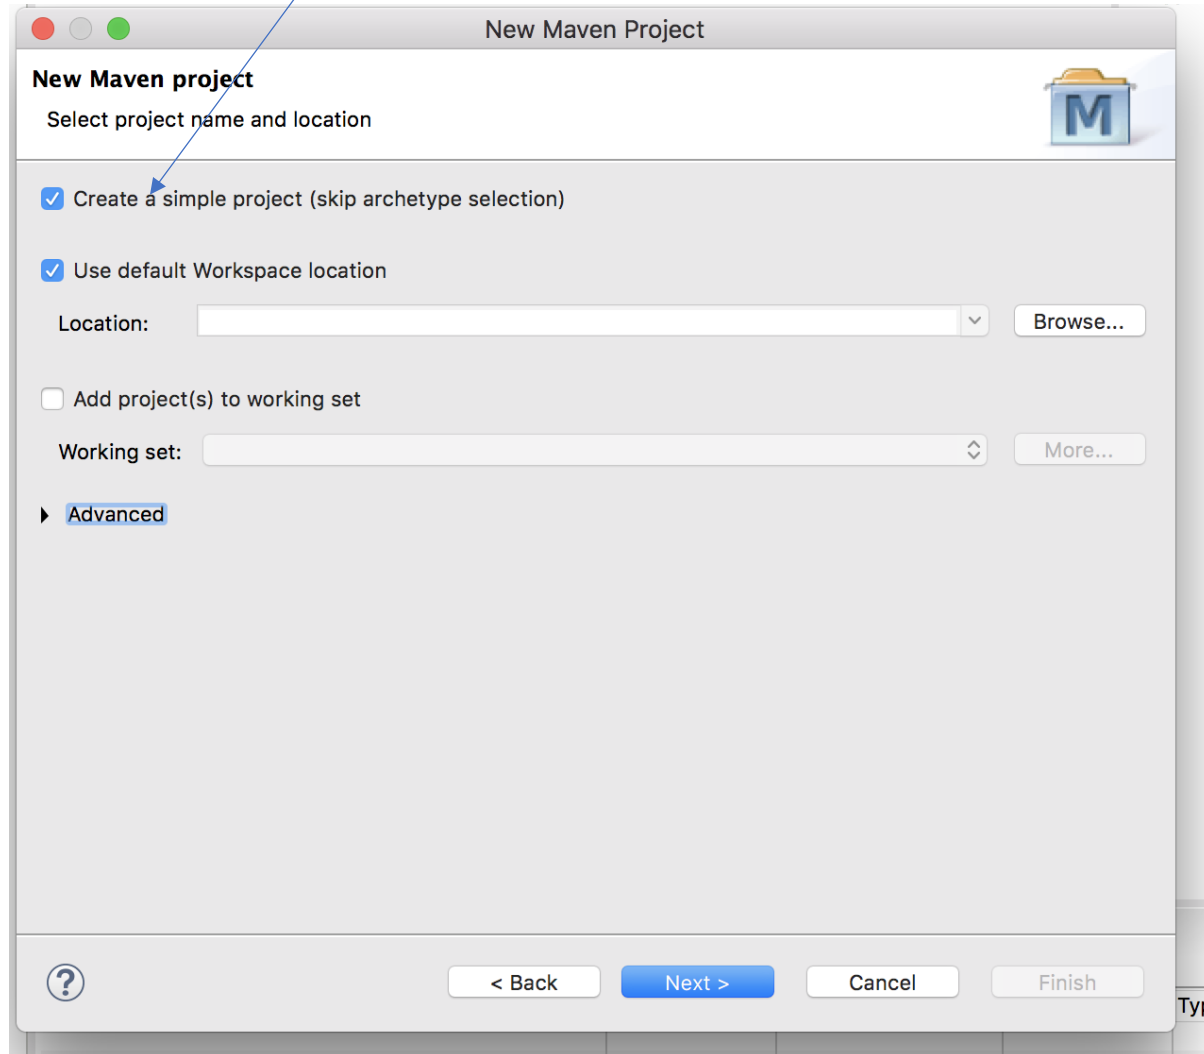

2. Open Eclipse. We can see a window like this

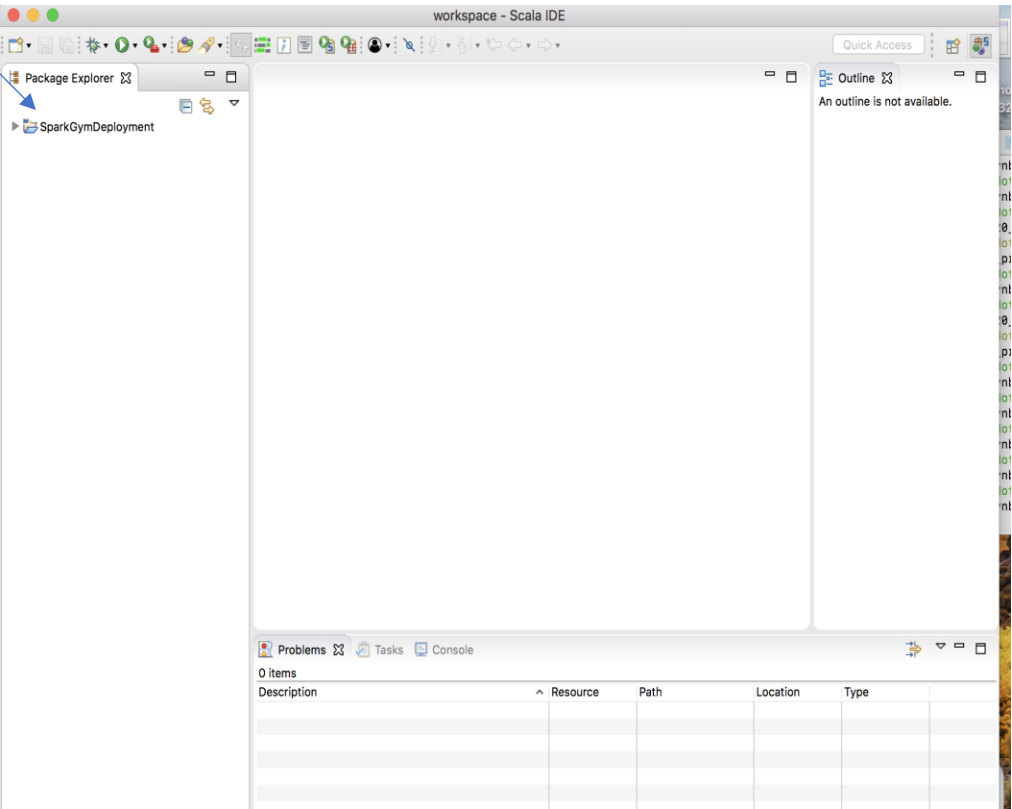

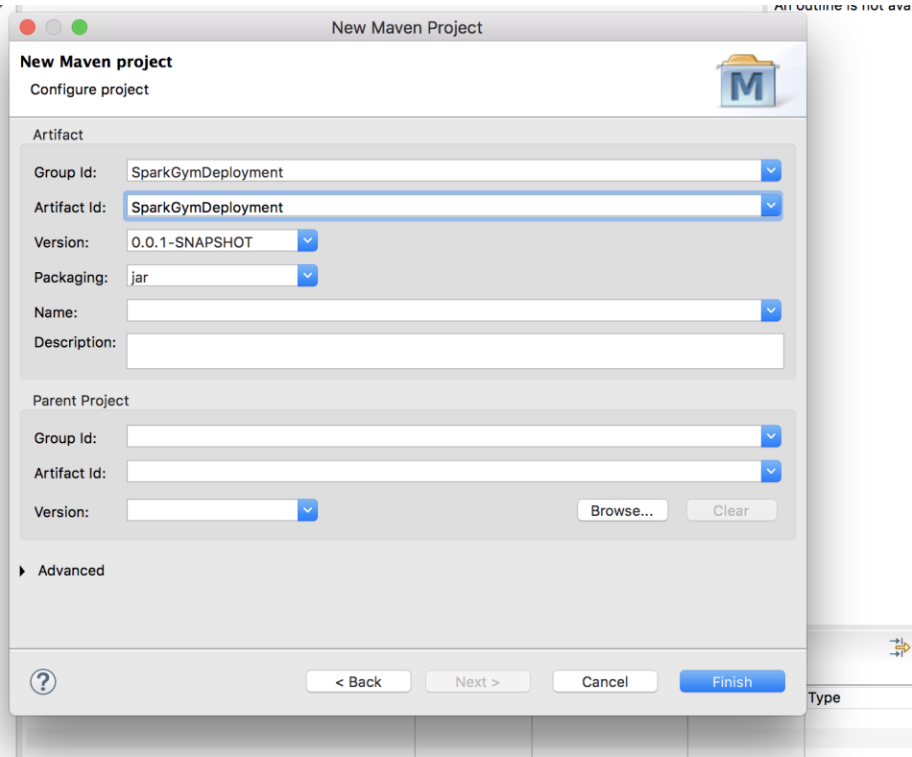

3. Go to File ----New ----Other .
We can see the following panel.
4. Select Maven -- Maven Project

5. Mark "create a simple project" box

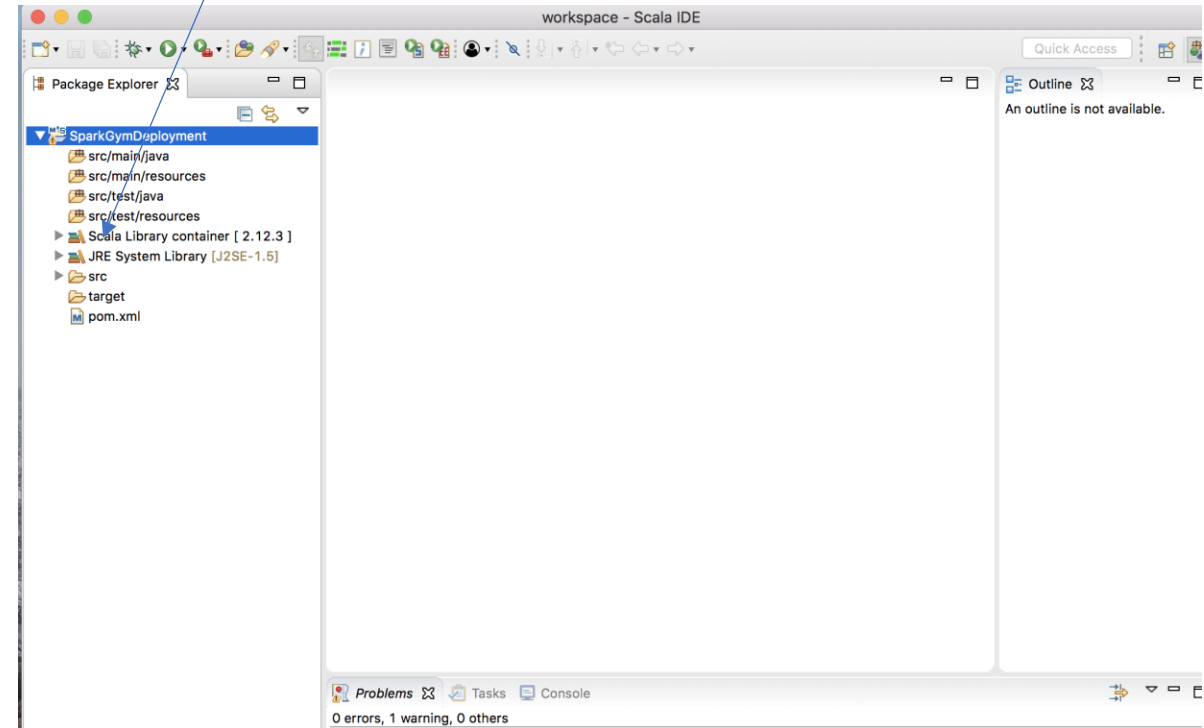

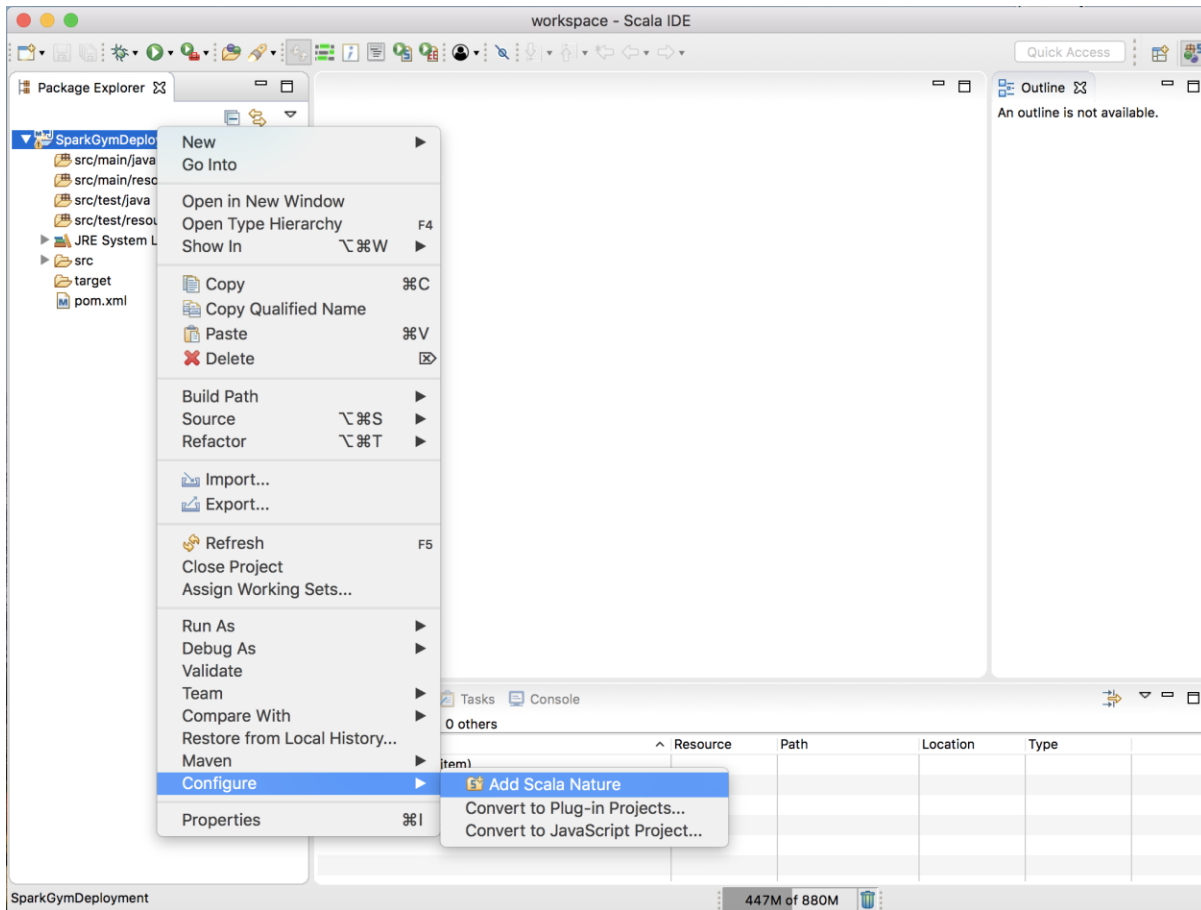

- 6. Give Group Id and Artifact Id. Both can be same. Click Finish
- 7. We can see the project created in the eclipse panel.

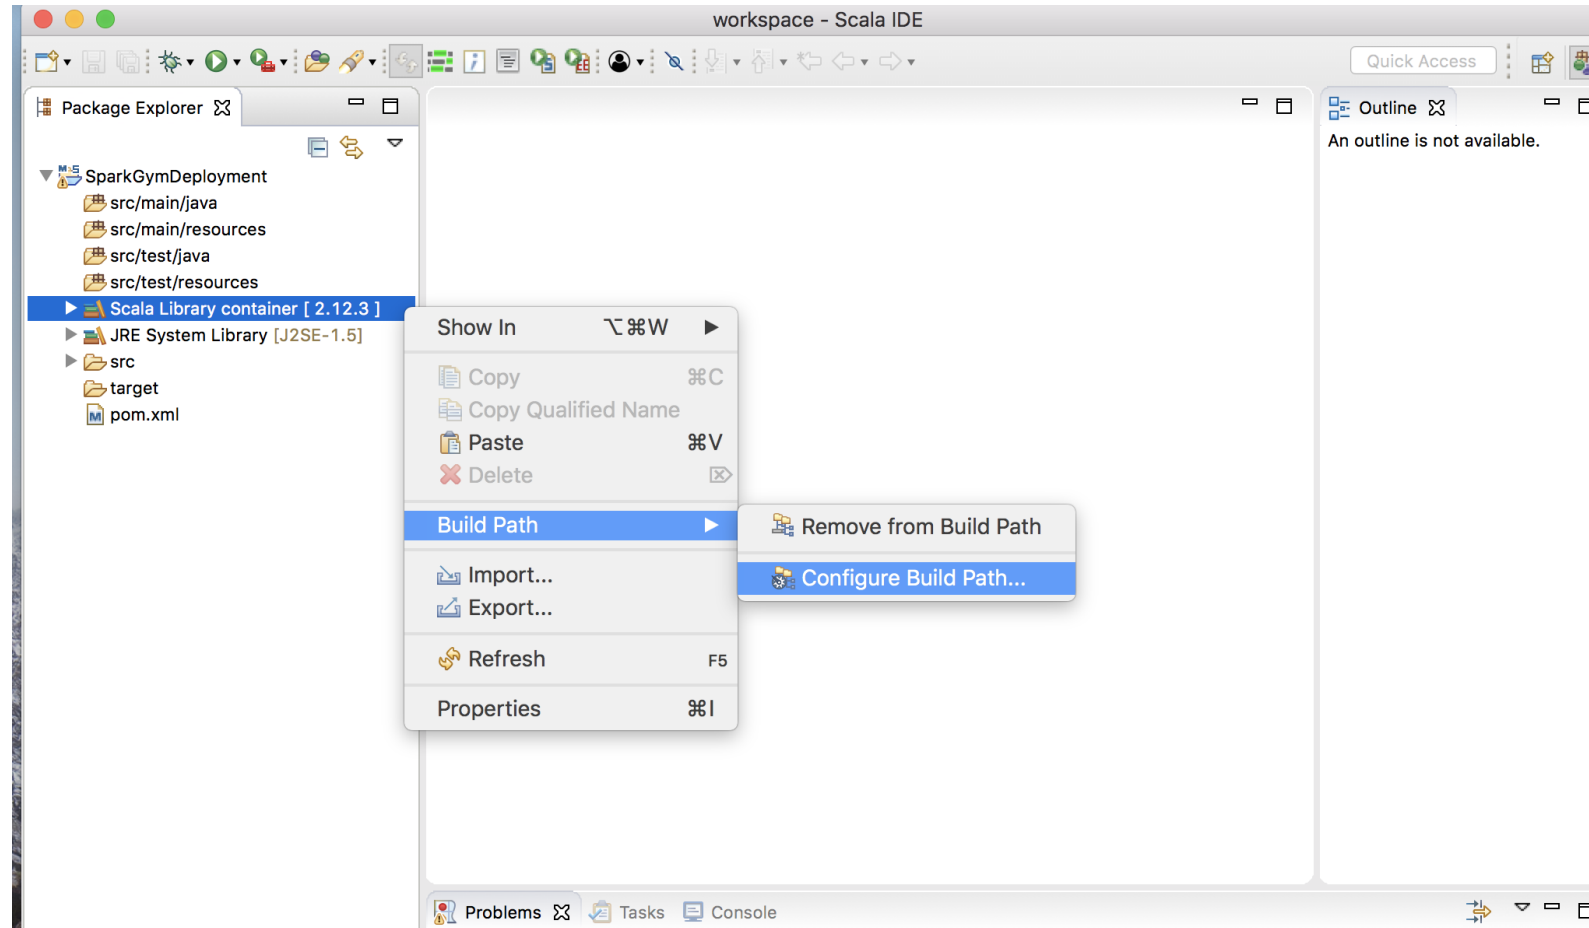

7. Add Scala nature.

Right click – configure – Add Scala Nature. Scala Libraries container will be updated.

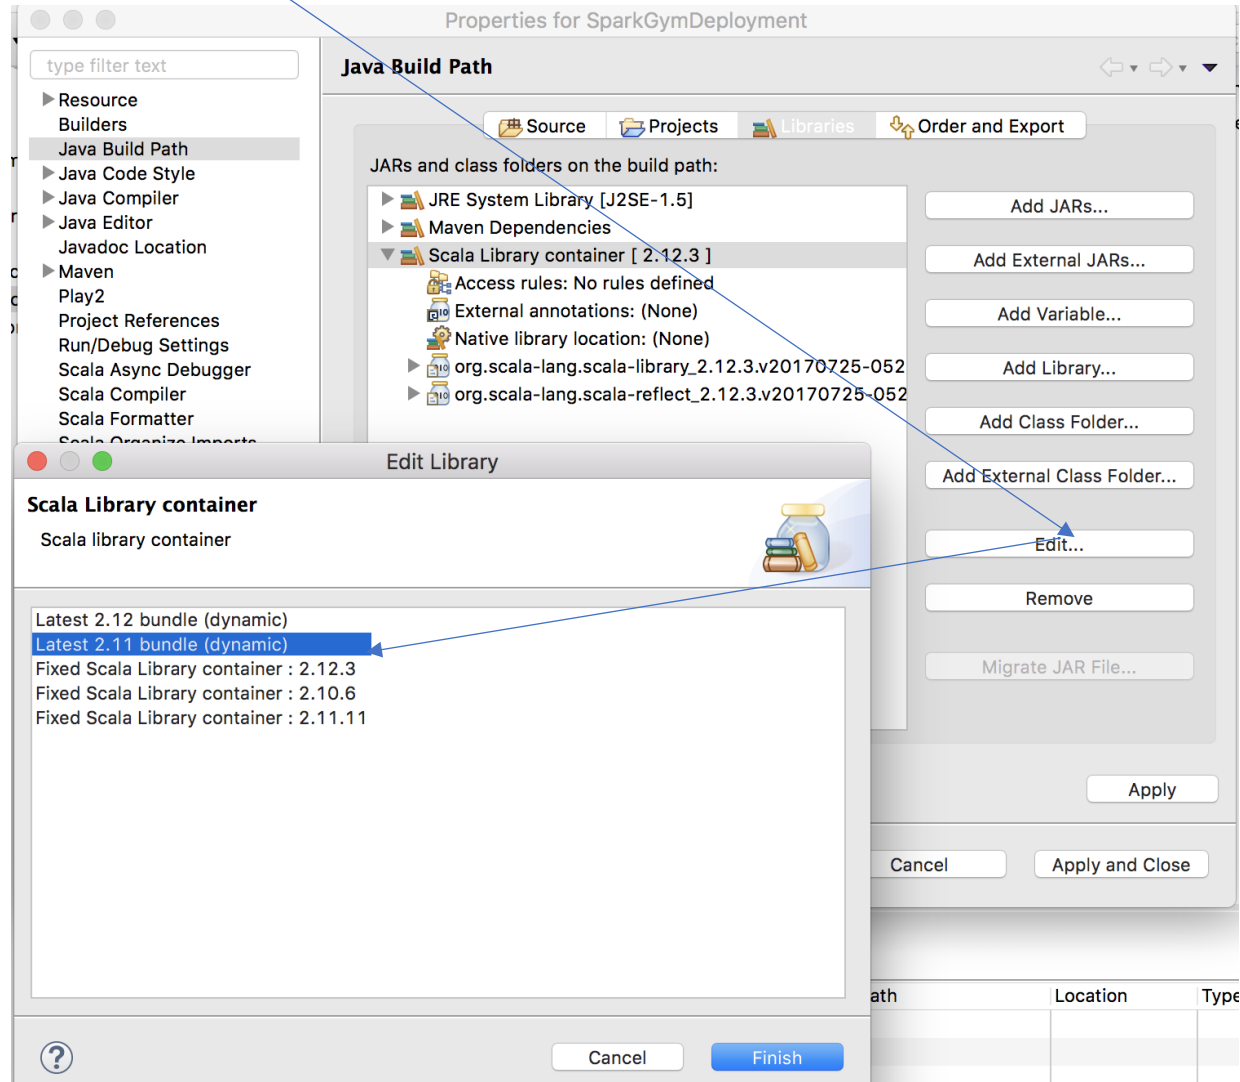

8. Configure build path

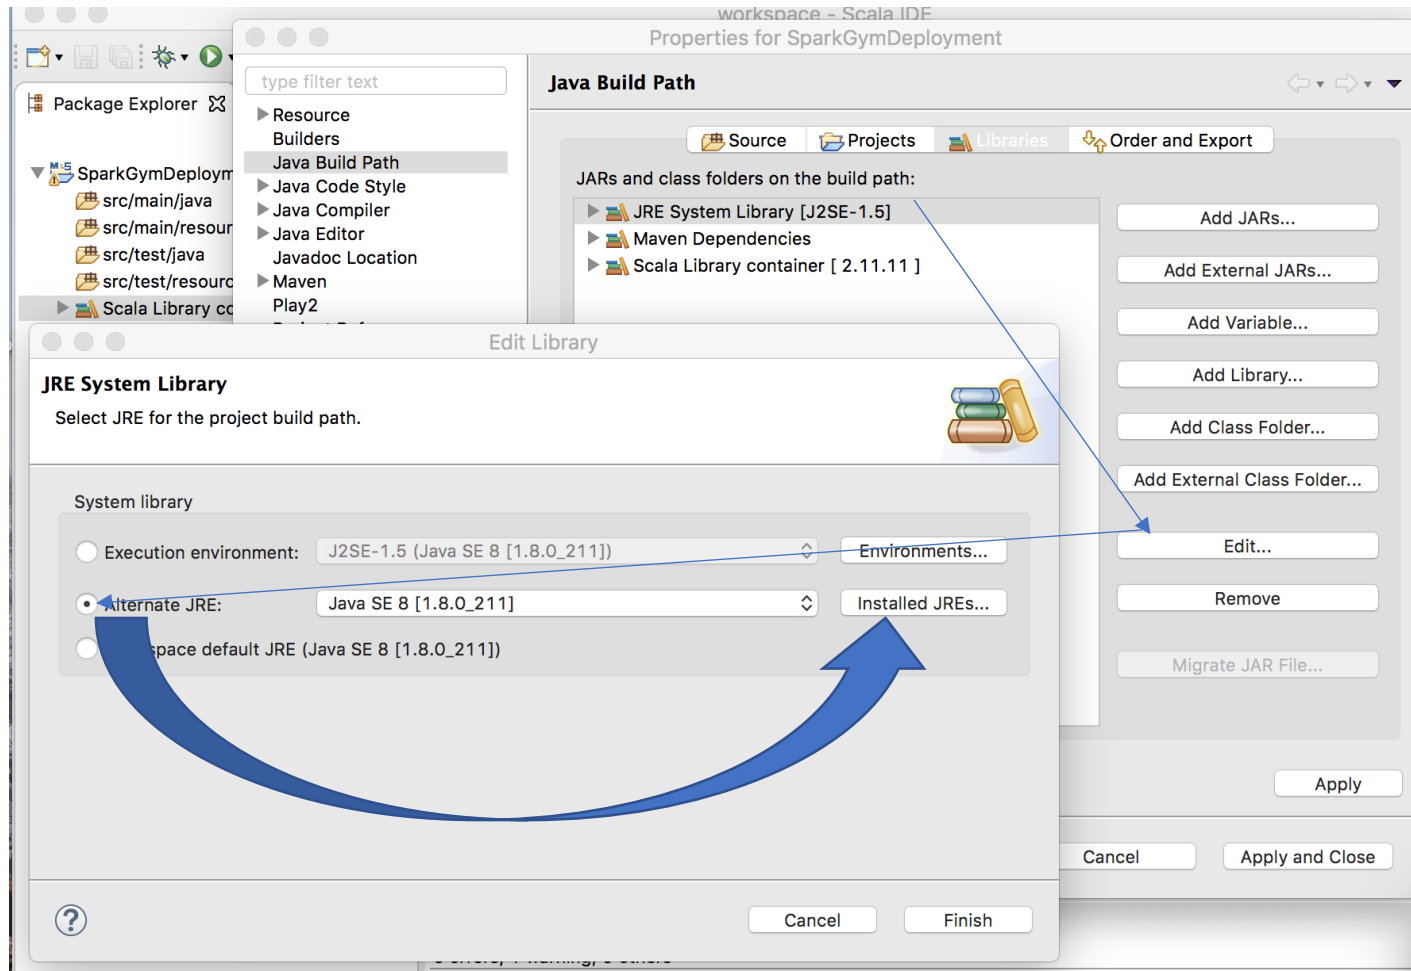

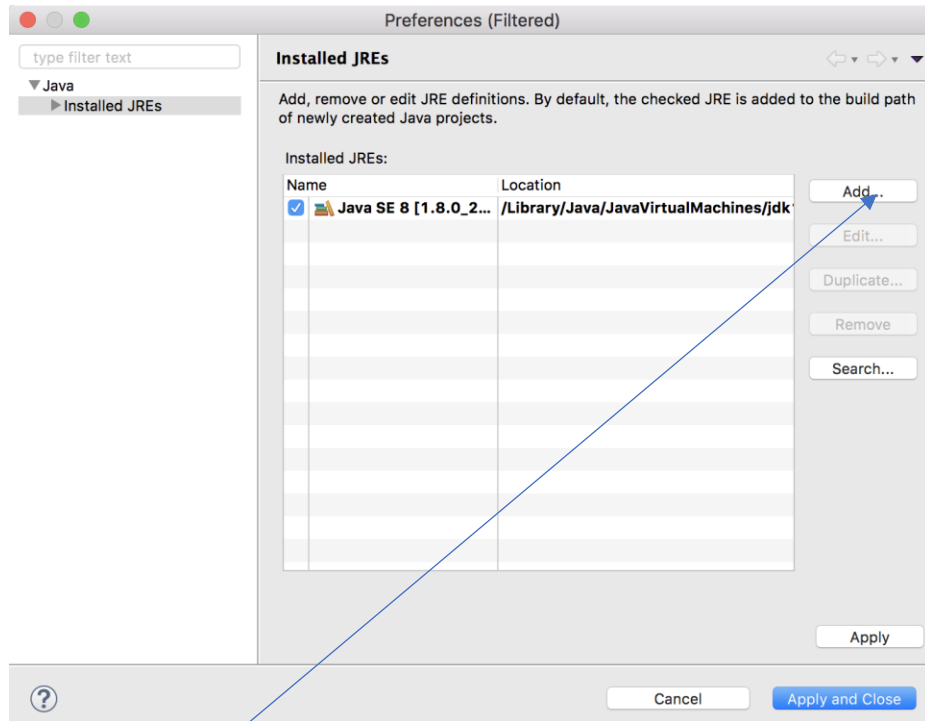

9. Go to Edit

10. Click the Second option

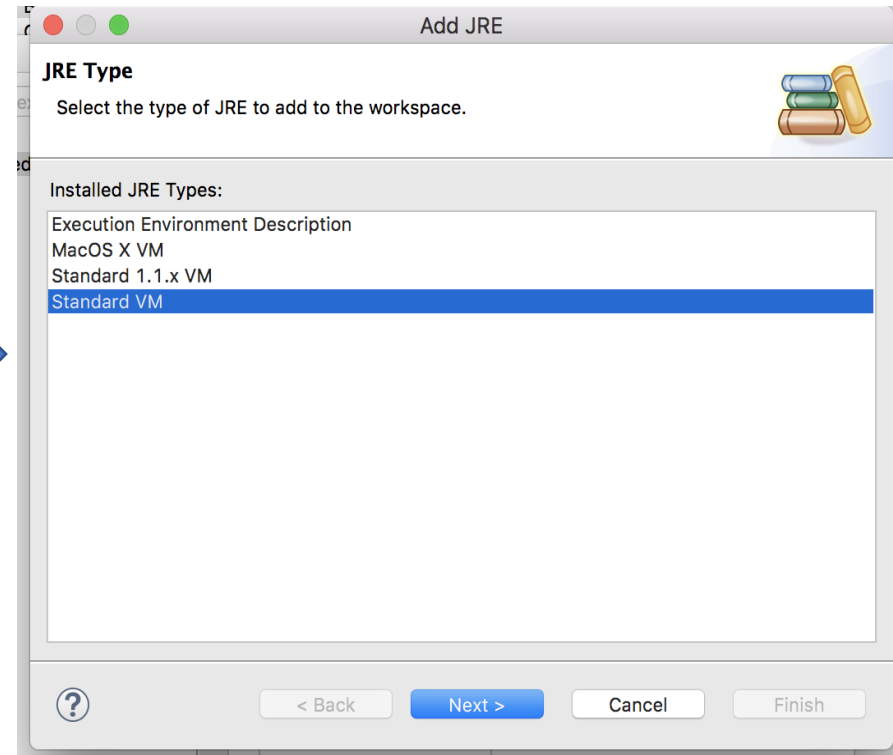

11. Go to JRE System Library.
Follow the Arrows in the pic. Go to Installed JREs

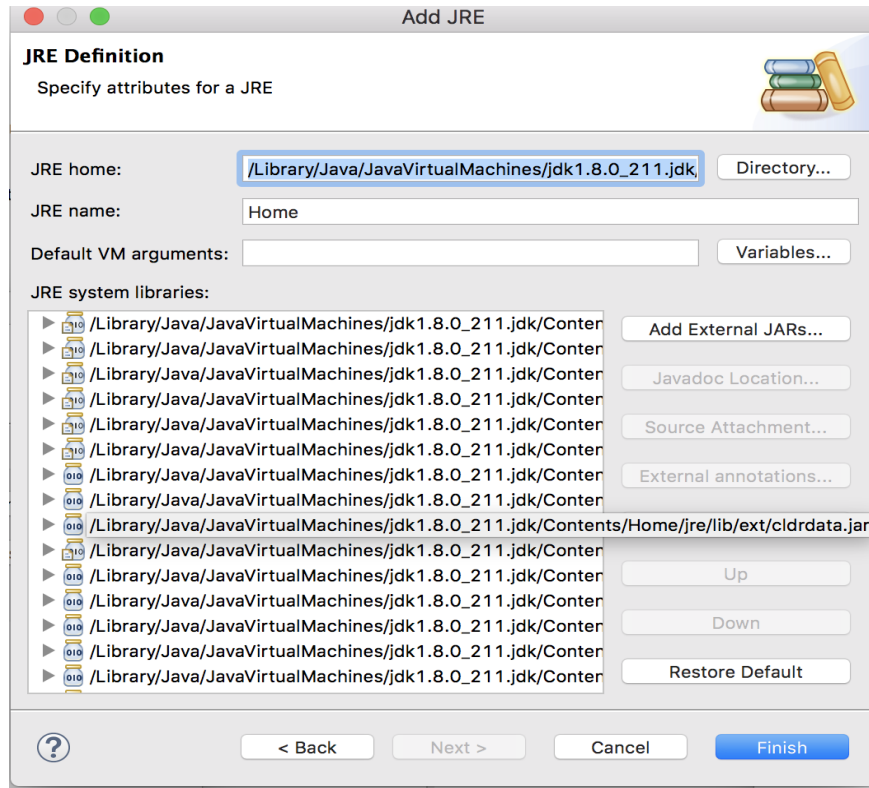

12. Click Add

13. Select Standard VM

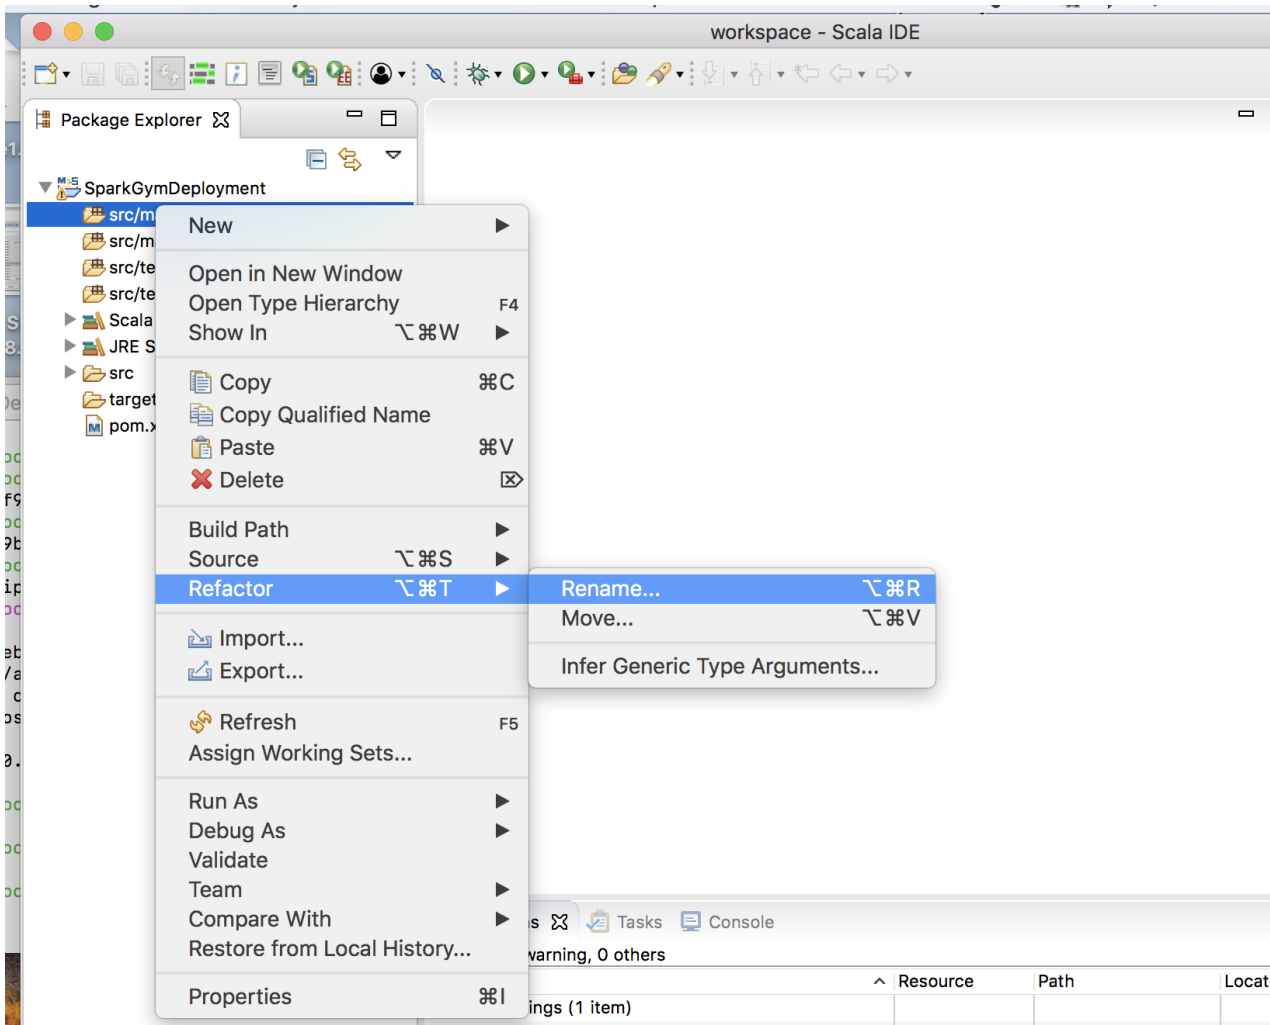

14. Click Finish and

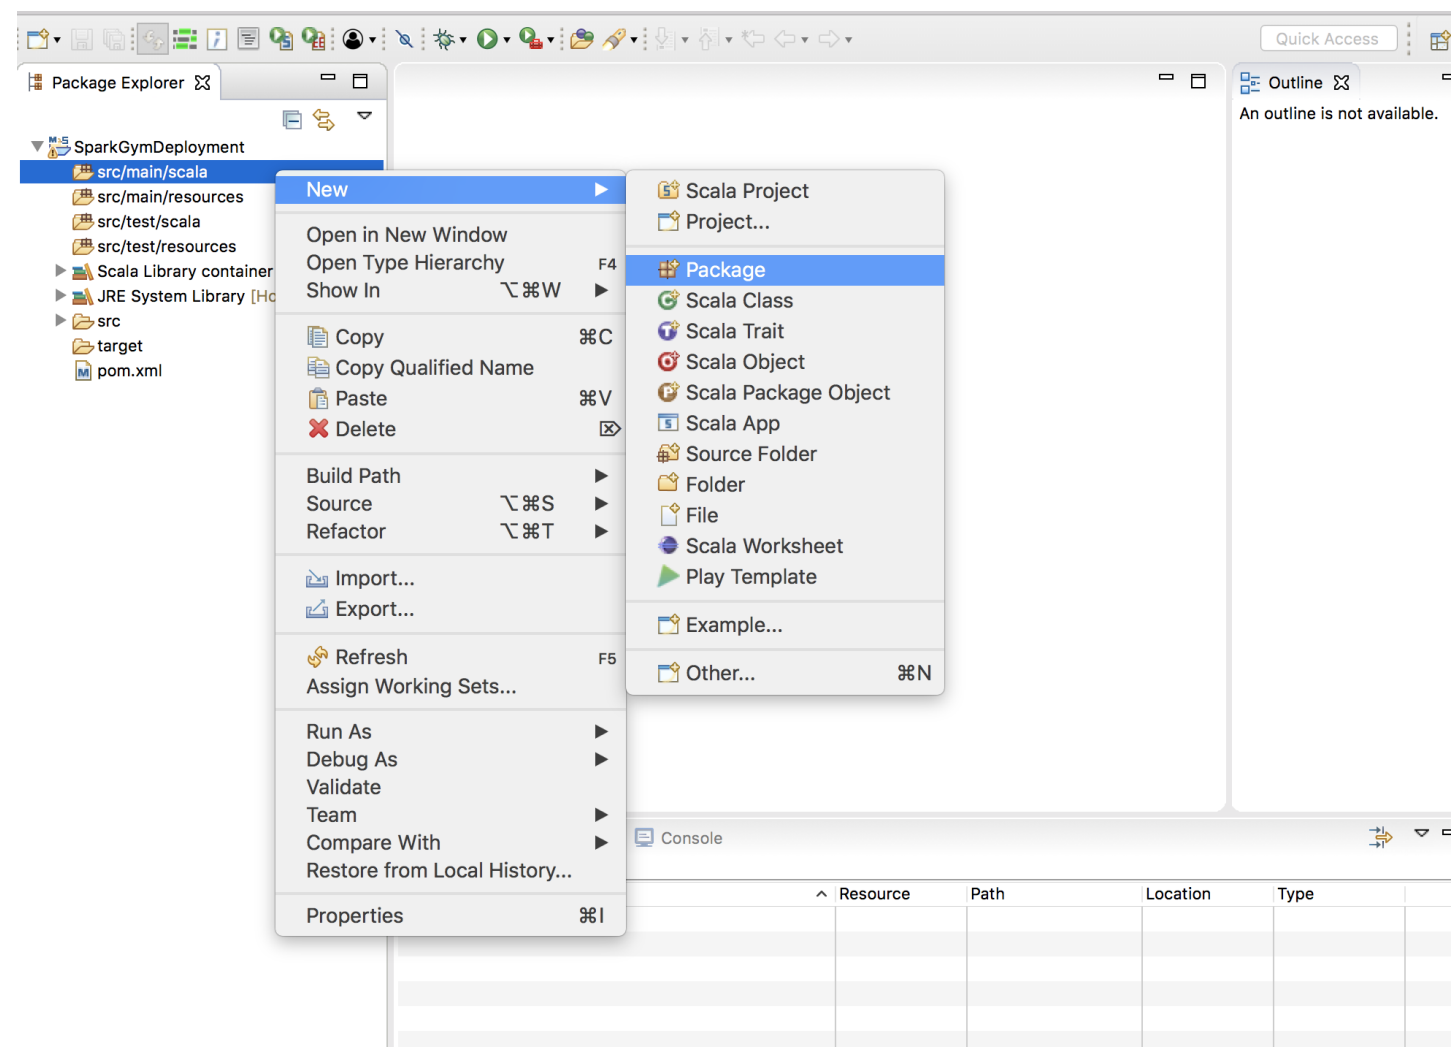

JRE HOME = /Library/Java/JavaVirtualMachines/jdk1.8.0_211.jdk/Contents/Home (In Mac)

JRE HOME = /C:///PROGRAMS/JAVA/JDK1.8 (Check path properly. It will be where we downloaded JAVA)

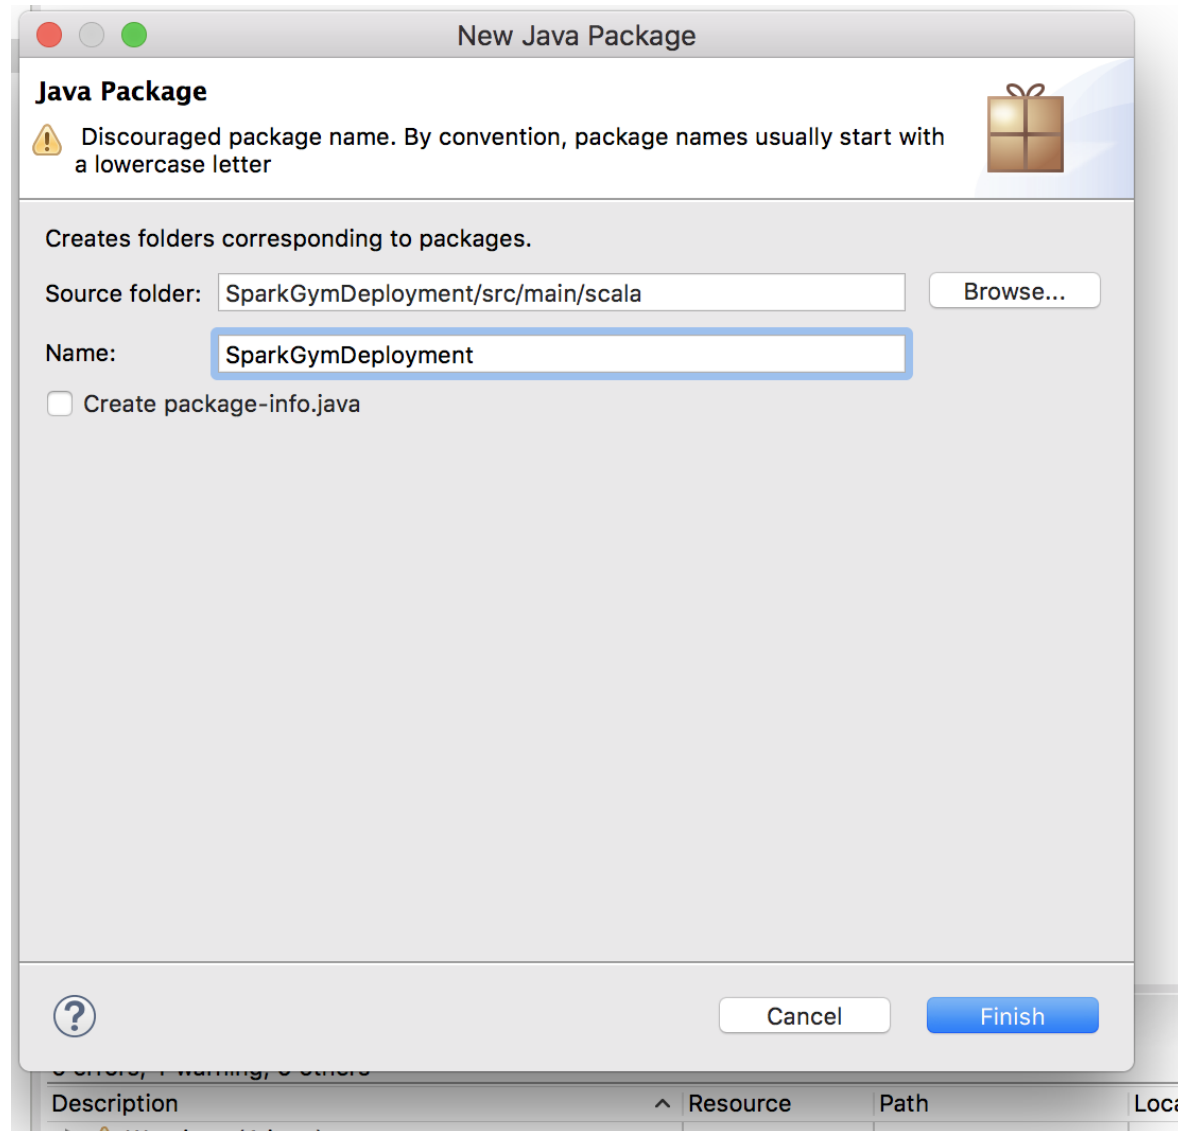

15. Renaming: /src/main/java to /src/main/scala
/src/test/java to /src/test/scala

16. Create package

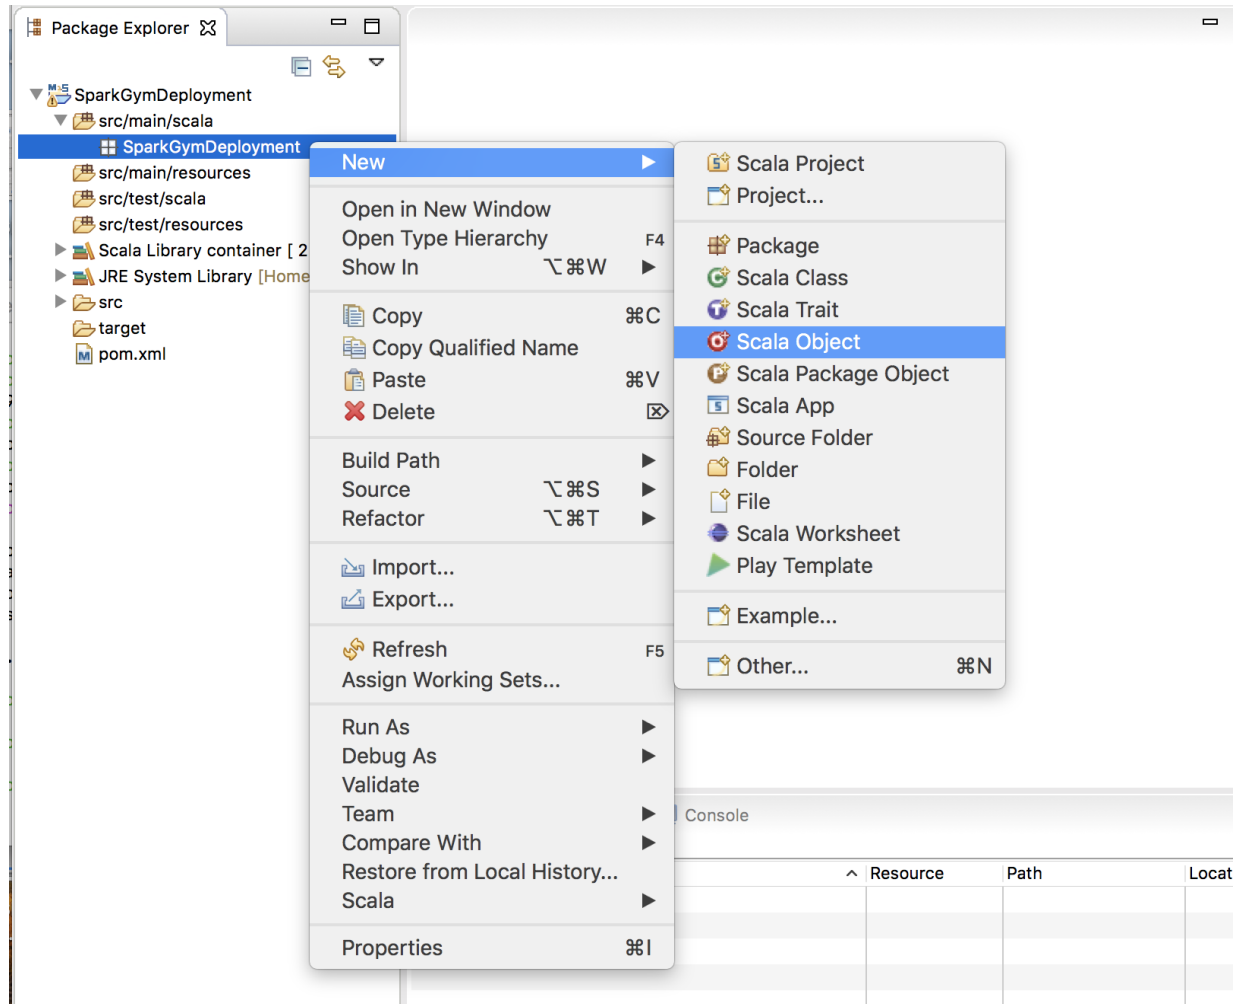

Give the Name as same and click Finish

17. Create Scala object

Give objectName as same in the Name column

New File Wizard

Create New File

Kind:  Scala Object ▼

Source Folder: SparkGymDeployment/src/main/scala

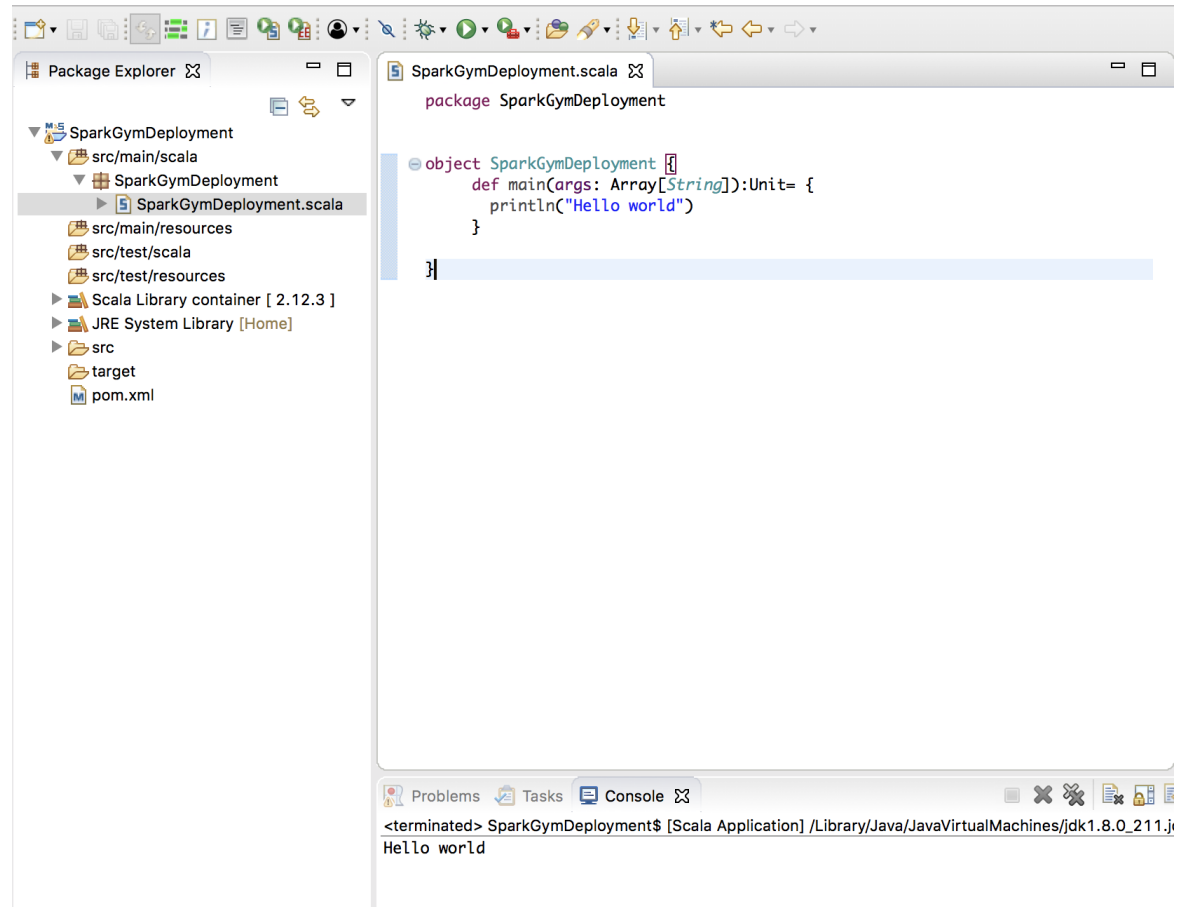

Name: SparkGymDeployment.SparkGymDeployment

The wizard uses a template in [Scala → Editor → Templates](#) to create the content of a new file.
The corresponding templates start with "wizard_" and can be freely edited.

 Cancel Finish

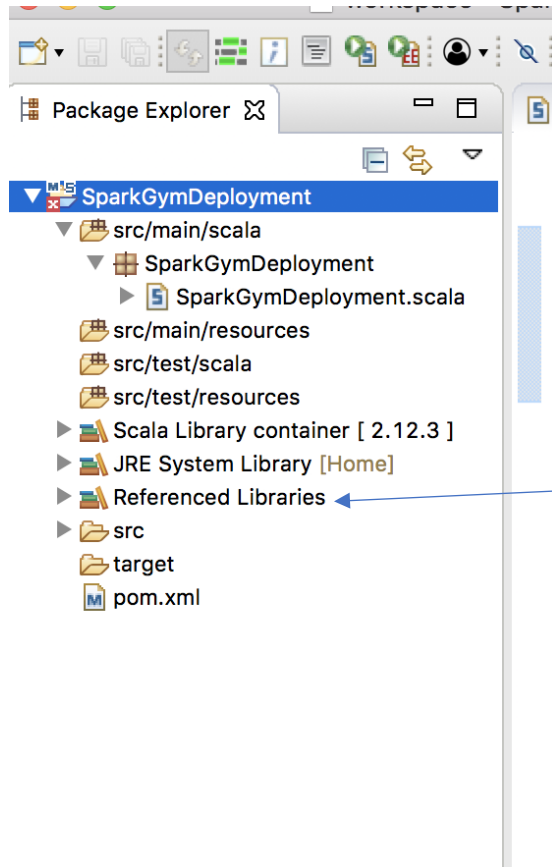

Location

18. Check Hello world problem

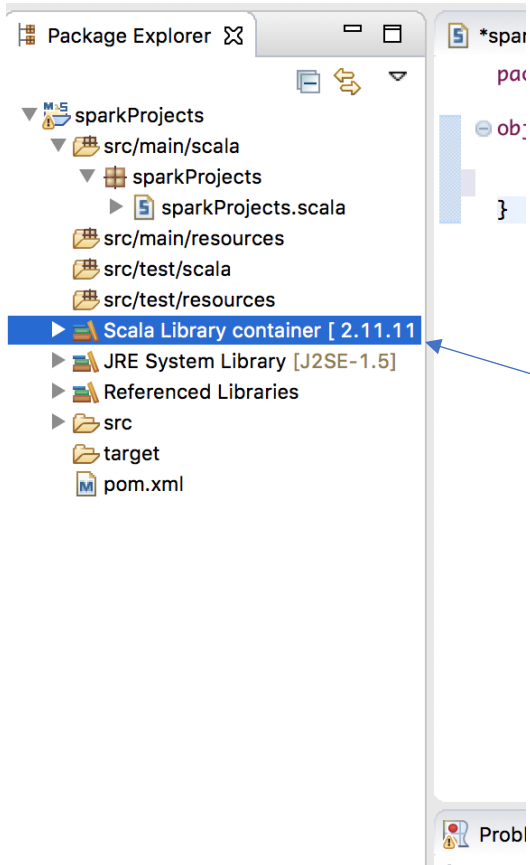

19. Configure Spark environment. Download spark-2.3.0-bin-hadoop2.7 from onedrive. After the below path, go to Libraries –Add External Jars –select all jars (command+A / ctrl +A) --open –Apply & close

Now we can see Referenced Libraries. Now we can say our project is powered with Spark environment

If it is something else go to properties and select this option
